

Helios Diagnostics

Rapid bedside detection of sepsis, 4 hours before current standard of care

Series A investor presentation

The problem

Sepsis kills 350,000 adults in the United States each year.

Diagnosis today relies on blood culture, which takes 24-48 hours.

Each hour of delayed antibiotics raises mortality by roughly 8 percent.

US hospitals spend \$62B a year on sepsis care (HCUP, 2024).

Our solution

Helios Rapid Panel is a cartridge-based host-response assay.

Whole blood in, risk score out, in 55 minutes on existing analysers.

Runs on the installed base of analysers already in 4,100 US hospitals.

Clinical validation

Prospective study across 3 academic centres, 512 enrolled patients.

Sensitivity 91 percent, specificity 88 percent against adjudicated diagnosis.

Results published in a peer-reviewed journal in 2026.

Regulatory pathway

FDA De Novo pathway; pre-submission meeting held in Q1 2026.

Breakthrough Device designation granted 2025.

Submission targeted for Q3 2027 following the pivotal study.

Business model

Razor/razorblade: analyser software licence plus per-test cartridge revenue.

Cartridge ASP \$220; gross margin 68 percent at 50,000 units.

Reimbursement: CPT PLA code application filed; hospital budget purchase in the interim.

Traction

3 paying hospital pilots: Mercy General, Bayview Health, Northside University.

\$480,000 in pilot revenue booked in the last twelve months.

\$2.1M NIH SBIR Phase II grant awarded 2025.

Two further LOIs signed with regional health systems.

Competition

Cepheid and Karius compete on pathogen identification, not host response.

Inflammatix is the closest direct competitor with a host-response panel.

Our differentiation is the 55-minute run time on installed analysers.

Team

Dr Alina Reyes, CEO - previously VP Clinical at a diagnostics company acquired in 2022.

Dr Tomas Lindqvist, CTO - 14 years in assay development, 6 issued patents.

Head of Regulatory hired 2025; VP Commercial is an open role.

Intellectual property

Two granted US patents covering the host-response gene signature, expiring 2041.

One pending continuation on the cartridge fluidics.

Financials

Current burn \$310,000 per month; 9 months of runway at 30 June 2026.

Use of proceeds: pivotal study 55 percent, manufacturing scale-up 25 percent, commercial build 20 percent

The ask

Raising \$12M Series A in priced equity at a \$38M pre-money valuation.

\$3.5M committed from existing investors and a strategic.

\$1.2M soft-circled from angels.

Target close November 2026.

Existing investors include Kestrel Seed Partners and Longview Family Office.
